The following guideline recommends screening for depression, assessing suicide risk, following diagnostic criteria, shared decision-making and treatment planning, monitoring and adjusting treatment.

### Eligible Population

- **Adults 18 years or older, including pregnant and postpartum women**

### Detection and Diagnosis:

Screen for depression with adequate systems in place to ensure accurate diagnosis, effective treatment and appropriate follow-up [A]. Use a validated screening tool (e.g. PHQ-2, PHQ-9) [A]. Assess if criteria are met using DSM-5 criteria [A]. Criteria A, B, C and D must be met.

#### DSM-5 criteria

- **A. Symptoms**
  - 1. Depressed mood
  - 2. Marked diminished interest/pleasure
  - 3. Significant weight gain/loss, appetite decrease/increase
  - 4. Insomnia/hypersomnia
  - 5. Psychomotor agitation/retardation noticeable by others
  - 6. Fatigue/loss of energy
  - 7. Feelings of worthlessness or inappropriate guilt
  - 8. Diminished concentration or indecisiveness
  - 9. Recurrent thoughts of death or suicidal ideation
  - 10. Hopelessness

- **B. Symptoms cause clinically significant distress or impairment in functioning**

- **C. Symptoms not attributed to a substance or other medical condition**

- **D. Lack of psychotic disorder or history of manic or hypomanic symptoms**

Assess for comorbid conditions that might impact treatment (e.g., medical and medication-induced conditions, drug or alcohol abuse, bipolar disorder, anxiety disorders, psychosis).

### Assessment of suicide risk:

Assess risk of suicide by direct questioning about suicidal ideation, and if present, suicidal planning, potential means, and personal/family history of suicidal attempts. [D] See established clinical tools for risk assessment and suicide prevention.  

If patient at moderate to severe risk for suicide, refer to emergency department or crisis intervention center. Develop safety plan.

### Treatment and follow-up:

- **Educate and engage patient**. Include self-management support and life-style modifications (e.g., behavioral activation, healthy sleep and diet, exercise, stress-management, social support, spiritual support, online support) [C].

- **Utilize shared decision-making in treatment planning** [A]. Consider onset and severity of symptoms, impairment, past episodes, psychosocial stressors, medical and psychiatric comorbidities, patient preference, resource accessibility. For mild to moderate symptoms consider pharmacotherapy and/or evidence-based psychotherapy [A]. For severe symptoms consider both pharmacotherapy and evidence-based psychotherapy [A].

- **Monitor response to treatment using standardized scale (e.g., PHQ-9)**. On PHQ-9, adequate response is 50% reduction in score, remission=total score <5.

- **Consider referral to behavioral health specialist when additional counseling is desired, primary physician is not comfortable managing patient's depression, diagnostic uncertainty, complex symptoms or social situation, response to medication at therapeutic dose is not optimal, considering prescribing multiple agents, or more extensive interventions are warranted** [D].

- **If initiating antidepressant medication, follow manufacturer's recommended doses. If no response after 2-4 weeks, increase dosage as tolerated to exceed the highest recommended dose. If discontinuing antidepressant, taper dose over several weeks.**

- **If limited or no response to treatment, assess for non-adherence, inadequate dosing, diagnostic inaccuracy or comorbid conditions exacerbating symptoms. Consider: increased doses of medication or frequency of psychotherapy, switching treatments or augment treatment with other medications or psychotherapeutic interventions, consultation.**

Patients with recurrent major depression usually require lifelong treatment. Continue medication for at least 9 - 12 months after acute symptoms resolve. [A]

1. Edinburgh Postnatal Depression Scale
2. Suicide Prevention for Primary Care Toolkit
3. Suicide Assessment Five-step Evaluation and Triage

**Levels of Evidence for the most significant recommendations:**

- A = randomized controlled trials
- B = controlled trials, no randomization
- C = observational studies
- D = opinion of expert panel
